Macro Terminal

A one-page dashboard, styled like a trading terminal, of where the Brazilian and US economies and markets stand today, built only on public data, with an AI-written summary checked against the data.

WHAT IT SHOWS

- Interest rates, inflation, the dollar and unemployment for Brazil and the US, with what economists expect for this year and next, plus prices, risk and company results for large stocks.
- Alerts when something important changes, such as inflation leaving the official target band, and a check on every download so a broken source never shows wrong numbers.
- A weekly summary and answers to questions written by Claude, where every number is confirmed against the data. The page refreshes itself through GitHub.

Code: https://github.com/gcabralcavalcanti/macro-terminal

HOW AI WAS USED

I use Claude (Claude Code and the API) for coding, review and documentation. The questions, modelling choices, validation and conclusions are mine.
